## **Abstract**

### **eFORMINFO – The vision, aims and objectives**

Confronted with the problem to conceive set-ups adapted to lifelong learning in the domains of the ICT and the multimedia, the various institutions partners of the project have shown, for several years, interest in the open and distance learning. This modality has to allow, besides the fact of surmounting constraints of time and space appropriate to the situation of every person, to answer in a flexible way a strongly diverse demand in its contents and to adapt itself to different learning profiles, this by implementing a pedagogy inspired by a competence-based approach.

Concerning the open and distance learning, it seems that set-ups work for the greater part with a set of modules and of educational resources more or less scripted, coupled with a variable tutorial accompanying, and resulting in the allocation of a certification preserving modalities of classic assessment.

Considering this situation, the partners considered that we could improve the Open and Distance Learning by adopting modalities of assessment at a distance, built according the approach through competence.
